Identity and concept

My name is Ehab Fakhralden Mohamed Hamid.

App name	EFMHPortfolio, from the initials E.F.M.H.
Student	Ehab Fakhralden Mohamed Hamid
Registration	25/27950
Verification code	MOB-A2-7950
Package	rw.ac.ines.ug2527950.efmhportfolio
Intended recruiter	A recruiter for an internship or a first software role
Portfolio focus	Programming: Python, Java, C, and C++

The app replaces a paper CV for a short meeting. The recruiter installs one APK, opens it without Expo Go, and can read the introduction, four programming projects, and contact status while the phone is offline.

Visual direction: a dark teal theme. The ground is void teal #0A1417, cards are deep teal, body text is off-white #EDF5F4, secondary text is sage #8FB3B0, the accent is amber #F2A65A, and teal #1F7A6C marks secondary buttons. The layout stays in one column so a narrow Android phone and a larger system text size can scroll instead of clipping.

User flow and information architecture

Five bottom tabs hold the major sections. Projects is the only nested stack. Android Back from a project detail returns to the project list and leaves the other tabs as they were.

- Home: introduction, portrait, headline, biography, primary skill, code MOB-A2-7950, offline note.
- Skills: four skill cards, then an education and training timeline.
- Projects: project list, then Project details with problem, contribution, and technology.
- Profile: capture or choose a portrait and a verification-card photo, edit four fields, save or reset.
- About: app name, student, registration, code, version, package, data-use statement, card preview.
- Saved state: Save writes AsyncStorage. Reset deletes that record and the copied images.
- Media: permission denial and cancellation keep the current image and show a message.
- Connection: the email link is labeled Needs a connection. Everything else is local.

Annotated wireframes

Home

My name is Ehab
Fakhralden Mohamed Hamid.
[portrait]
EFMHPortfolio
Headline
Availability badge
Short biography
Primary skill
MOB-A2-7950
Works offline

Skills

SKILLS
Python programming
Java programming
C programming
C++ programming
Education timeline
Empty state if none

Projects

PROJECTS
Python automation tool
Java console application
C file parser
C++ inventory program

Annotation: the first sentence on Home is the required name sentence, before the app name.

Annotation: skill cards and timeline rows are reusable components, not one-off layouts.

Annotation: each project card opens the stack route Project details and passes the project id.

Error and empty

Headline too short
field message in red
Save was blocked
Card photo empty:
dashed empty state
Permission denied
Selection cancelled

Validation rules: headline 8–80 characters; biography 40–400 characters and at least six words; primary skill 2–40 characters using letters, spaces, and hyphens; availability must be one of the three statuses. An invalid save does not write AsyncStorage.

Visual and accessibility decisions

Void #0A1417
Screen background

Mist #EDF5F4
Body text

Amber #F2A65A
Labels and the save button

Sage #8FB3B0
Secondary text

Teal #1F7A6C
Secondary buttons

Type: serif for the introduction and project titles, sans for controls. Body text is 15–16 pt with line height around 22 so enlarged system text wraps inside the scroll view.

Spacing: 16 pt page padding, 10–16 pt gaps, and 48 pt minimum height on buttons and choice rows.

Contrast: off-white text on void #0A1417, sage for secondary text, and void text on the amber button. Error text is light on a dark red field.

Labels: image actions include the slot name, for example Take a photo for Verification card. The external link exposes Needs a connection in its accessible name.

Large text: screens scroll. The name sentence is not limited to one line. Tab labels stay short: Home, Skills, Projects, Profile, About.

Images: the default portrait can be replaced from the Profile tab. Remove clears the saved reference after Save.

Offline: no portfolio content is fetched from the network. The email link is marked Needs a connection.

Implementation comparison

The built screens follow these wireframes. The comparison below records the choices that changed during implementation and why they were kept.

App name on Home

The wireframe showed the app name first. The build places the required name sentence first, then the portrait and the app name, so the assessor sees the exact sentence immediately.

Verification card

The profile image and the handwritten-card photo are separate slots. Home shows the portrait. About shows the card preview the demonstration video asks for.

Five tabs

About is its own tab rather than a button on Home, so the release facts and data-use statement stay one tap away.

Availability

Three large choice rows replace a dropdown so the status is visible without an extra dialog and remains usable with large text.

Artwork

Project covers use the same void, amber, and off-white palette as the rest of the app.
